      ONCOGENIC and ONCOGENIC FORMS of the new protein.";
EMBO J. 11:43-48(1992).

-I- FUNCTION: ESSENTIAL COMPONENT OF A NEUREGULIN-RECEPTOR COMPLEX,
ALTHOUGHT NEUREGULINS DO NOT INTERACT WITH IT ALONE. GP30 IS A
POTENTIAL LIGAND FOR THIS RECEPTOR. NOT ACTIVATED BY EGF, TGF-
ALDHA AND AMPHIREGULIN.

-I- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
tyrosine phosphate.
-I- SUBUNIT: HETERODIMER WITH EACH OF THE OTHER ERBB RECEPTORS.
THE CONSTITUTIVELY ACTIVATED ONCOGENIC VARIANT FORMS A HOMODIME

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              tyrosine phosphate.

SUBCELLULAR LOCATION: Type I membrane protein.

MISCELLANEOUS: Binding of EGF to the receptor leads to dimerization, internalization of the EGF-receptor compliance of the tyrosine kinase activity, stimulation synthesis, and cell proliferation.

SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SWISS-PROT entry is copyright. FUNCTION: Receptor for EGF, but also for other members of the EGF family, as TGF-alpha, amphiregulin, betacellulin, heparin-binding EGF-like growth factor, GP30 and vaccinia virus growth factor. Is involved in the control of cell growth and differentiation.

FUNCTION: Isoform 2/truncated isoform may act as an antagonist.

CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
expressed in ovarian cancers.
MISCELLANEOUS: Binding of Egr
dimerization, internalization
induction of the tyrosine kina

MISCELLANEOUS: Binding of EGF to the receptor leave the for receptor induction of the tyrosine kinase activity, stimulation of the tyrosine kinase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  nitted (JUN-1992) to the EMBL/GenBank/DDBJ databases.
FUNCTION: THE EGF RECEPTOR MEDIATES THE BIOLOGICAL SIGNAL OF EGF,
AND ALSO OF TGF-ALPHA, AMPHIREGULIN, HEPARIN-BINDING EGF, GP30 AN
VACCINIA VIRUS GROWTH FACTOR (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ; X78987; CAA55; U03425; AAA17; X59698; CAA42; L06864; AAA53; Z12608; CAA78; Z12608; CAA78

ALTERNATIVE PRODUCTS: A number of isoforms are produced be alternative splicing.
SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY.
SIMILARITY: CONTAINS 5 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAINS.
SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.

-!- FUNCTION: May be a signaling adaptor molecule involved in p75NTR-mediated apoptosis induced by NGF. May play an important role in the pathogenesis of neurogenetic diseases.
-!- SUBUNIT: Binds to the DEATH domain of p75NTR/NGFR.
-!- TISSUE SPECIFICITY: FOUND IN OVARIAN GRANULOSA CELLS, TESTIS, PROSTATE AND SEMINAL VESICLE TISSUE.
                                                                                                                                                                                                                                 MIM;
